

WEB PHISHING DETECTION

Phishing is a form of fraud in which the attacker tries to learn sensitive information such as login credentials or account information by sending as a reputable entity or person in email or other communication channels. Aim of the phishers is to acquire critical information like username, password and bank account details. Phishing attacks can paralyze a business. Staff might be unable to continue their work. Data and assets might be stolen or damaged. Customers might be unable to access online services. The reason security defenders struggle to detect phishing domains is because of the unique part of the website domain. The proposed aim is to build an intelligent, flexible and effective system that is based on using classification Data mining algorithm to detect phishing URLs.
